1. (WO 2005/109180) TWO-STAGE DATA VALIDATION AND MAPPING FOR DATABASE ACCESS	17.11.2005	G06F 17/30	PCT/US2005/009860	TELCORDIA TECHNOLOGIES, IN(

Input data queries directed at a plurality of target databases and originating from any of a plurality of sources are first converted to validated canonical forms, which are then used to query the target databases. Specifically, upon receiving a input data query, a relatively accurate reference database is selected based on the type of the input data. This reference is then queried for the input data with the intent of finding an exact matching record or a near-matching record that can be considered an exact match and thereby validating the input data. Otherwise, the requesting source is instructed to provide new query. Once having a validated record, it is converted to a canonical form, which is then used to query the target databases i...

| 2. (WO 2005/033975) REMOTE SCORING AND AGGREGATING SIMILARITY SEARCH ENGINE FOR USE WITH RELATIONAL DATABASES | 14.04.2005 | G06F 17/30 | PCT/US2003/027594 | INFOGLIDE SOFTWA CORPORATION |

A system and method for defining a schema and sending a query to a similarity search engine to determine a quantitative assessment of the similarity of attributes between an anchor record and one or more target records. The similarity search engine makes a similarity assessment in a single pass through the target records having multiple relationship characteristi The similarity search engine is a server configuration that communicates with one or more database management systems providing data persistence, data retrieval and access to user defined functions. The architecture enables search activities t be segmented among multiple remote database management systems for reducing the time required to perform searches. Implementation pr...

| 3. (WO 2005/017778) REMOTE SCORING AND AGGREGATING SIMILARITY SEARCH ENGINE FOR USE WITH RELATIONAL DATABASES | 24.02.2005 | G06F 17/30 | PCT/US2003/021935 | INFOGLIDE SOFTWA CORPORATION |

The invention provides a system and method for defining a schema and sending a query to a Similarity Search Engine (29 to determine a quantitative assessment of the similarity between an anchor record and at least one search record. The invention makes a similarity assessment in a single pass through the target records having multiple relationship characteristics. The Similarity Search Engine (290) is a server configuration comprising a Gateway (210) for command and response routing, a Virtual Document Manager (220) for document generation, a Search Manager (230) for SQL statemen generation, and one or more Database Management Systems (240) for data persistence and retrieval, and access to User Defined Functions (245). By locating the sc...

| 4. (WO 2003/069510) SIMILARITY SEARCH ENGINE FOR USE WITH RELATIONAL DATABASES | 21.08.2003 | G06F 17/30 | PCT/US2003/004685 | INFOGLIDE SOFTWA CORPORATION |

The invention provides a system and method for defining a schema and sending a query to a Similarity Search Engine to determine a quantitative assessment of the similarity of attributes between an anchor record and one or more target recor (Figure 1). The Similarity Search Engine makes a similarity assessment in a single pass through the target records having multiple relationship characteristics. The Similarity Search Engine is a server (190) configuration that comprises a Gateway for command and response routing (110), a Virtual Document Manager (120) for document generation, a Search Manager (130) for document scoring, and an Relational Database Management System (140) for providing data persistence, data retrieval and access to User D...

| 5. (WO 2002/080041) METHOD AND SYSTEM FOR PROCESSING QUERIES | 10.10.2002 | G06F 17/30 | PCT/US2002/009924 | GOLDMAN, SACHS & CO. |

REQUIRING COORDINATED ACCESS TO
DISTRIBUTED DATABASES

A method and system for coordinating access to a distributed database system, such as a financial services system databa
pool containing various sources of different types of data, receives as input a user query, such as a query related to the
status of financial transactions. The query is processed to determine the types of data required to satisfy the query and th
target data sources containing such data. Discrete sub-queries are formulated and issued to the identified target data
sources. The retrieved data is combined to generate a response to the query which is formatted and returned to the
requestor, preferably in the form of an Internet web page.

6. (WO 2002/006962) METHOD AND   24.01.2002   G06F 11/00   PCT/US2001/041166   DELTA AIR LINES, IN
   SYSTEM FOR CONDUCTING A TARGET
   AUDIT IN A HIGH VOLUME
   TRANSACTION ENVIRONMENT

A target audit methodology to provide a transaction-based detail of errors in an environment with a high volume of
transactions. The primary components comprise a distributed computer network, such as the global Internet, coupled to
numerous databases and a workstation. A Random Sample Query is used to pull a statistically valid sample from a gener
population of transactions to identify initial transaction errors. The initial transaction errors are analyzed to determine
parameters for identifying other similar errors with a high probability of occurrence within the total population of transaction
Possible Error Query is designed to retrieve these specific error types and is processed against the population of
transactions. The results...

7. (WO 2000/005664) SEARCH SYSTEM AND 03.02.2000   G06F 17/30   PCT/US1999/016953   JARG CORPORATIO
   METHOD BASED ON MULTIPLE
   ONTOLOGIES

A distributed computer database system includes one or more front end computers and one or more computer nodes
interconnected by a network into a search engine for retrieval of objects processed by a variety of interrelated ontologies.
Each object conforms to a specific ontology. A query is an object which conforms to a specific ontology, which is to be use
for retrieval of objects conforming to one or more target ontologies. A query from a user is transmitted to one of the front e
computers which forwards the query to one of the computer nodes, termed the home node, of the search engine. The hom
node extracts features from the query, according to its ontology. These features are then hashed. Each hashed feature an
the list of target o...

Search Summary

query: 7986 occurrences in 3150 records.

target: 73246 occurrences in 31025 records.

(query AND target): 115 records.

databases: 2516 occurrences in 1717 records.

((query AND target) AND databases): 7 records.

Search Time: 0.08 seconds.
